

BRACKET FOR HANGING ARTICLES

ABSTRACT

A bracket for hanging articles. The bracket includes a body portion having at least one side wall and at least one first aperture in which the body portion is attachable to a hanging surface. The bracket also includes a swingable hook. The swingable hook has a hooking portion, at least one side portion and at least one engaging portion in which each engaging portion is attached to one side portion. Each first aperture of the body portion engages at least one end portion of the swingable hook. In addition, each side portion of the hook may frictionally engage an inner surface of each side wall such that the swingable hook is swingably set to a plurality of positions. At least one protrusion located on an inner surface of the side wall may be used as an additional resting place for each side portion of the swingable hook.
